

# XML architectures for electronic business-to-business

By

Peter Stamps

March 28, 2001

 **SOFTWARE AG**

# <Agenda>

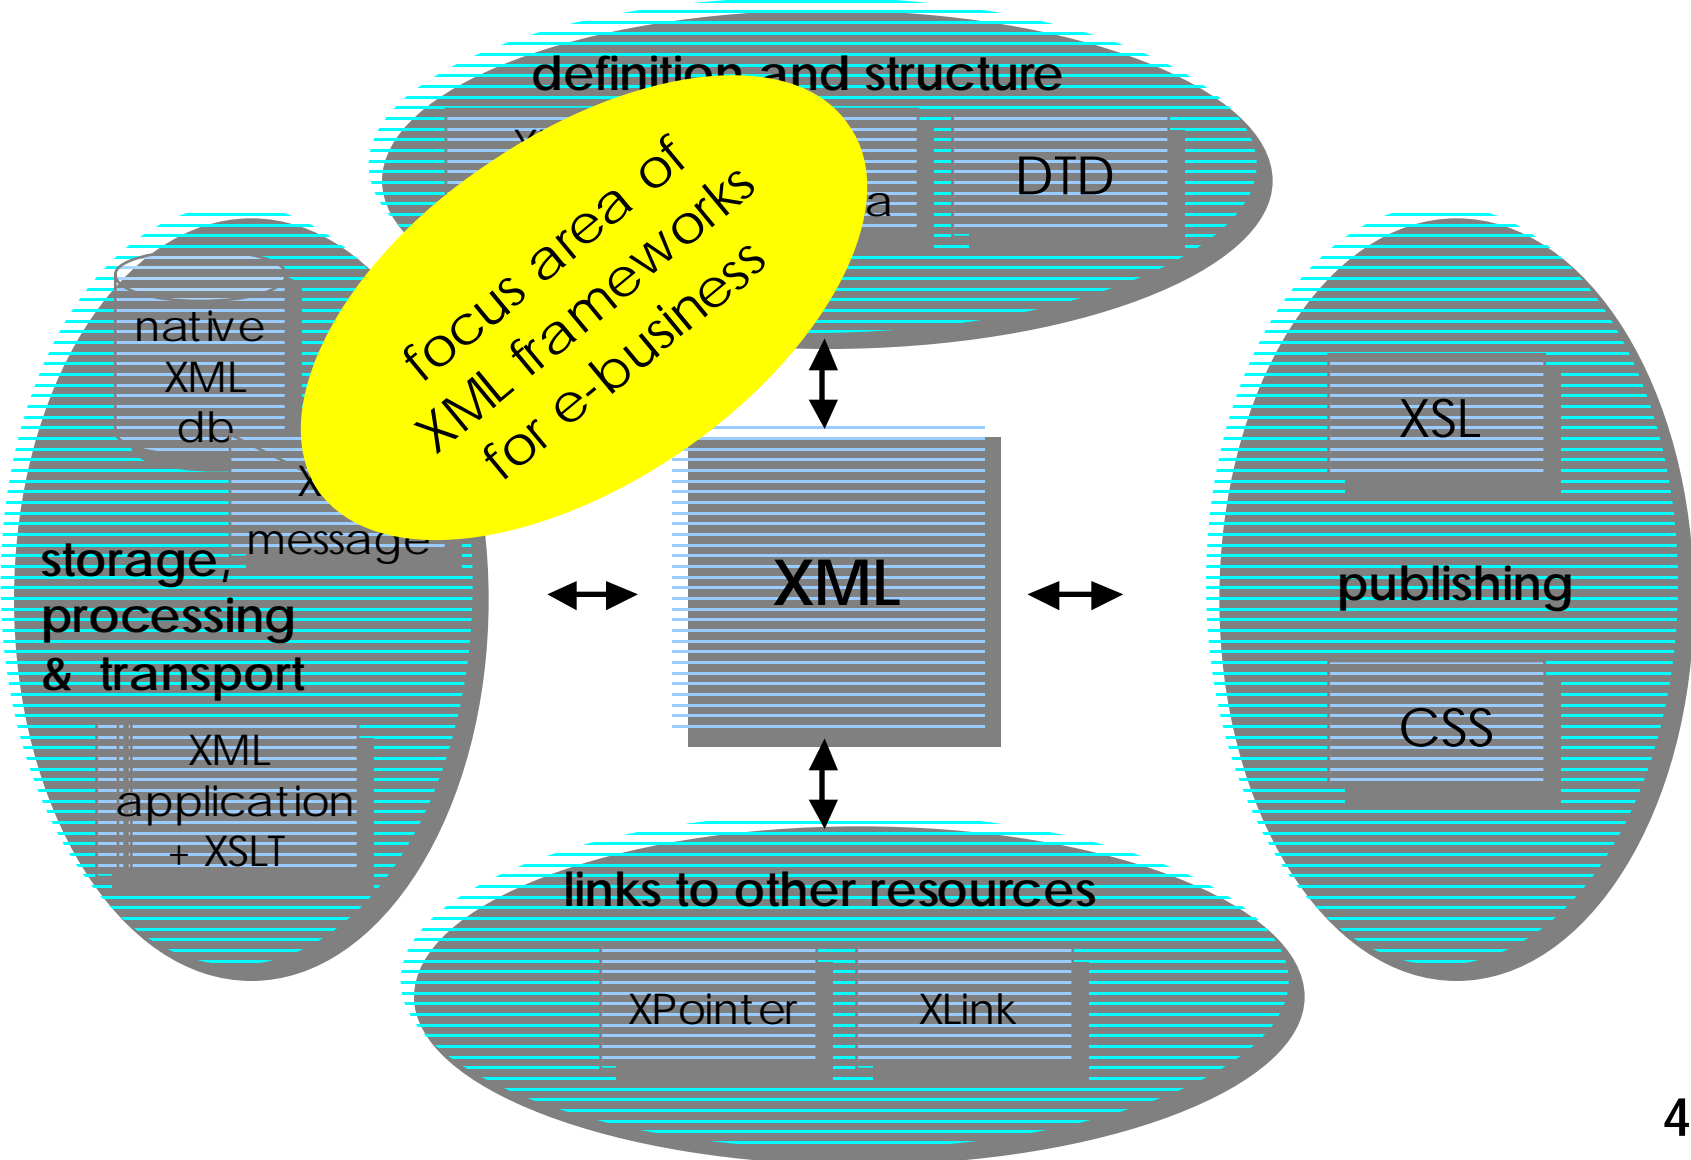

- XML usage & frameworks
- ebXML / BizTalk / eCo
  - Concepts
  - Architecture
  - Models
- Architecture of XML message broker
- B2B scenario using XML messages
- Exchange implies storage
  - Native or in tables?
- Working together
  - Classic systems with new XML based applications

# <XML usage>

# <XML usage>

# <Wellknown XML frameworks>

- An **open XML-based infrastructure** enabling the global use of electronic business information in an interoperable, secure and consistent manner by all parties.

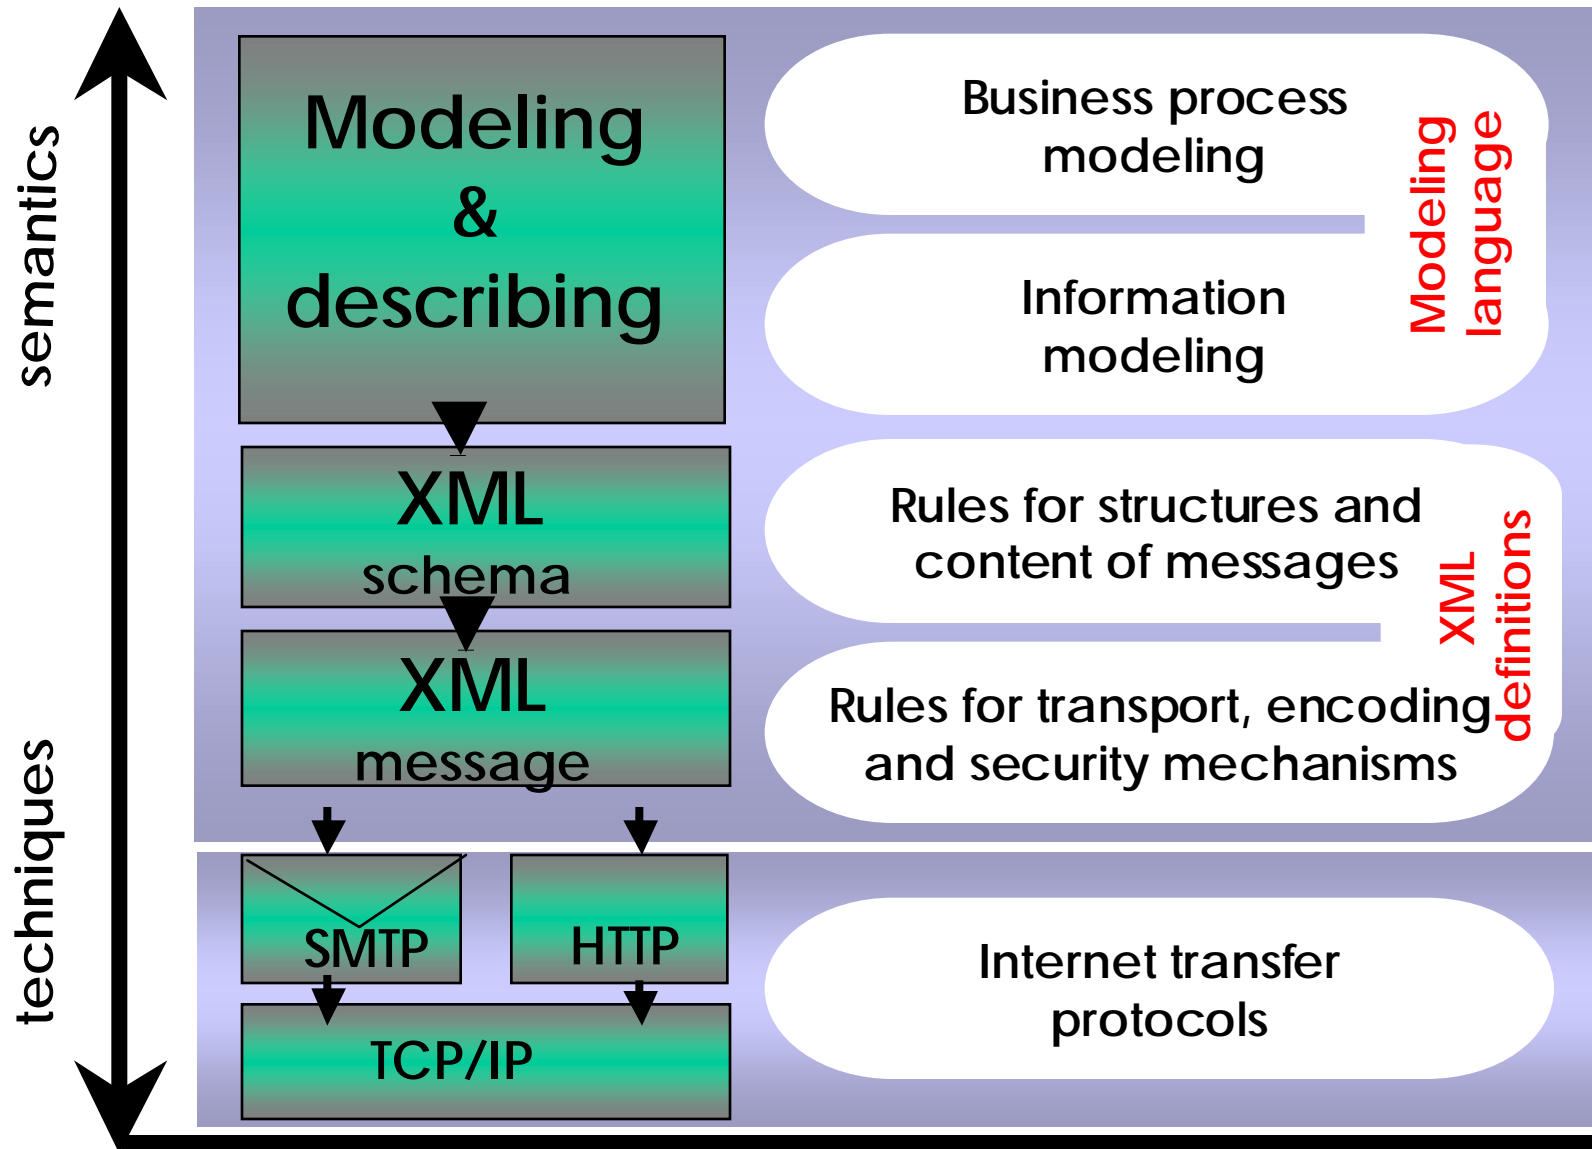

- The Microsoft (R) BizTalk framework is an **Extensible Markup Language (XML) framework** for application integration and electronic commerce.

- The eCo Specification is an **architectural framework** that enables businesses to discover each other on the World Wide Web and determine how they can do business

# <Architecture XML framework>

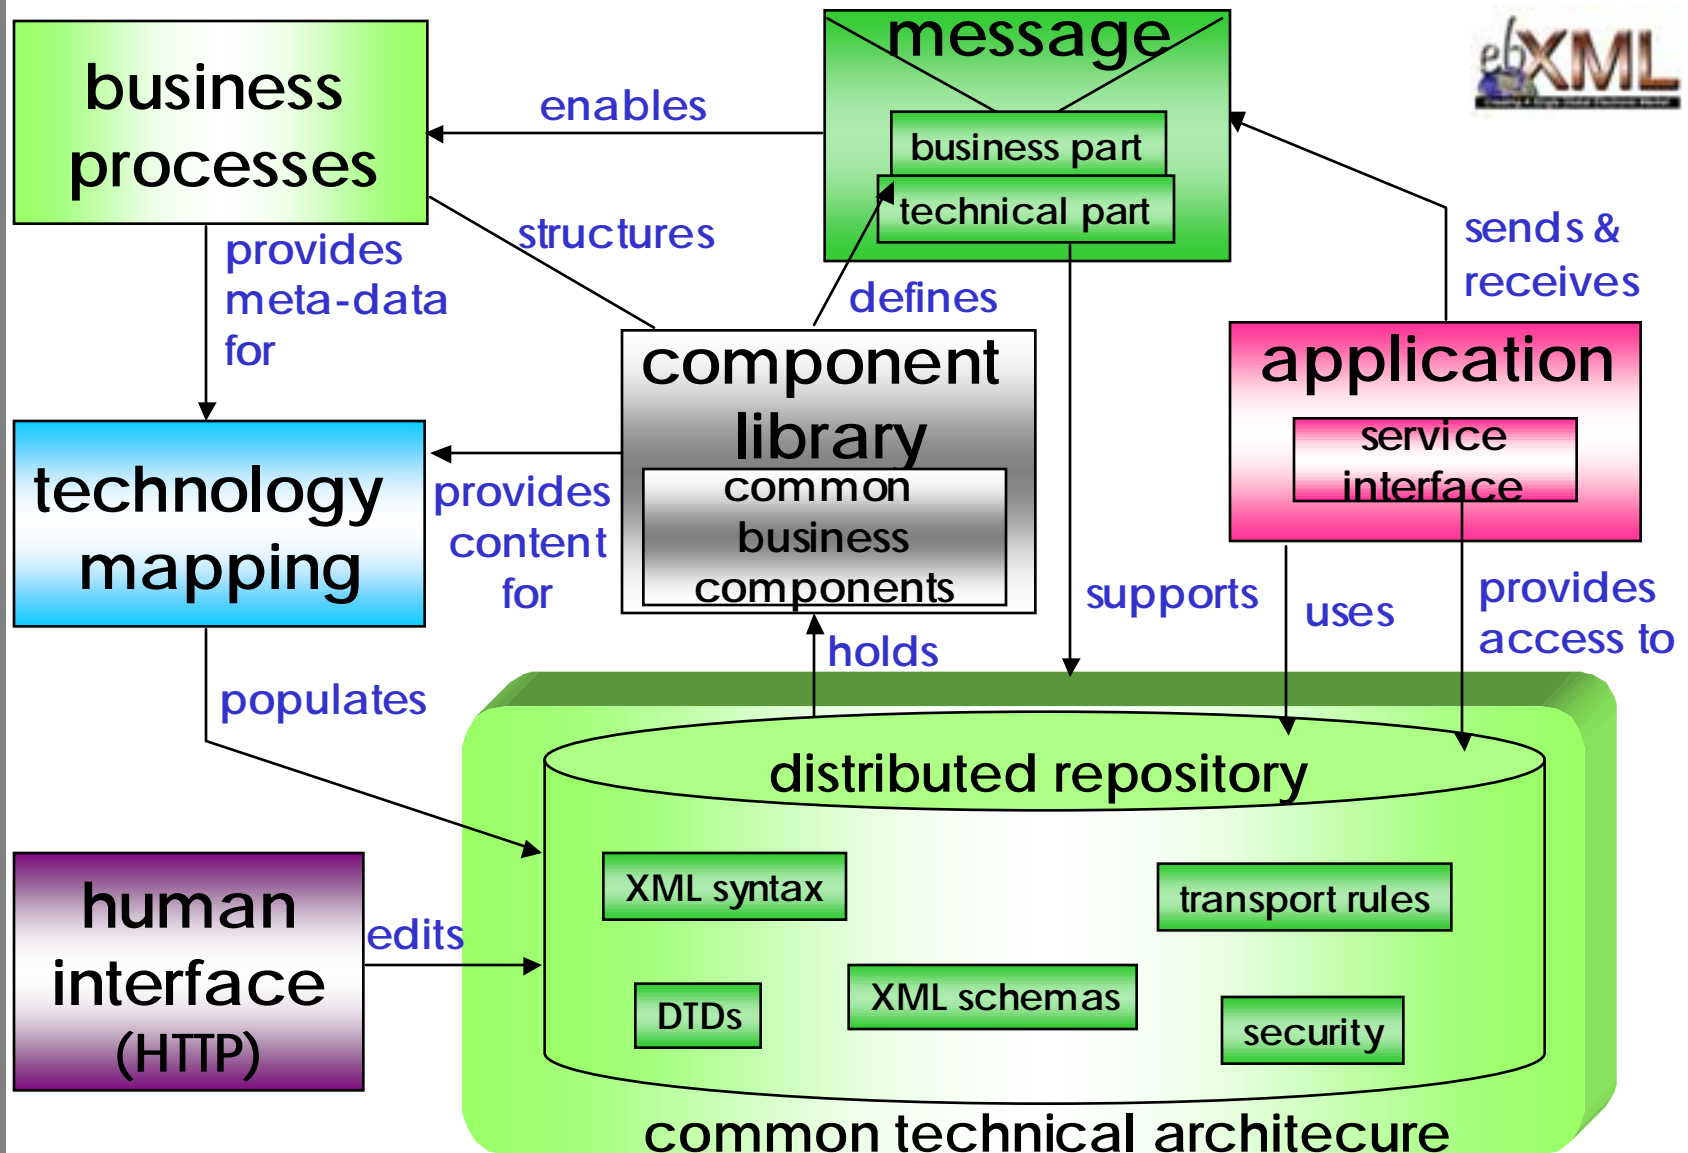

# <ebXML concepts & architecture>

- describes a business process and its associated information model
- registers and stores a business process and information meta model for sharing and reusing
- supports discovery of information about each participant
- describes a mutually agreed upon business arrangement
- describes a standardized business messaging service including configuration

# <ebXML architecture>

# <ebXML modeling techniques>

- **Requirements**  
(artifacts describing the problem)
  - Use Case Diagrams
  - Descriptions
- **Analysis**
  - Activity diagrams
  - Sequence diagrams
  - Class diagrams  
(capturing business messages)
- **Design**  
(e.g. applying object-oriented principles)
  - Collaboration diagrams
  - State diagrams
  - ...

**Based on  
Unified  
Modeling  
Language**

May be  
developed by  
industry groups,  
SMEs, and  
other organizations

# <ebXML registering models>

business processes & information meta-models documented using UML

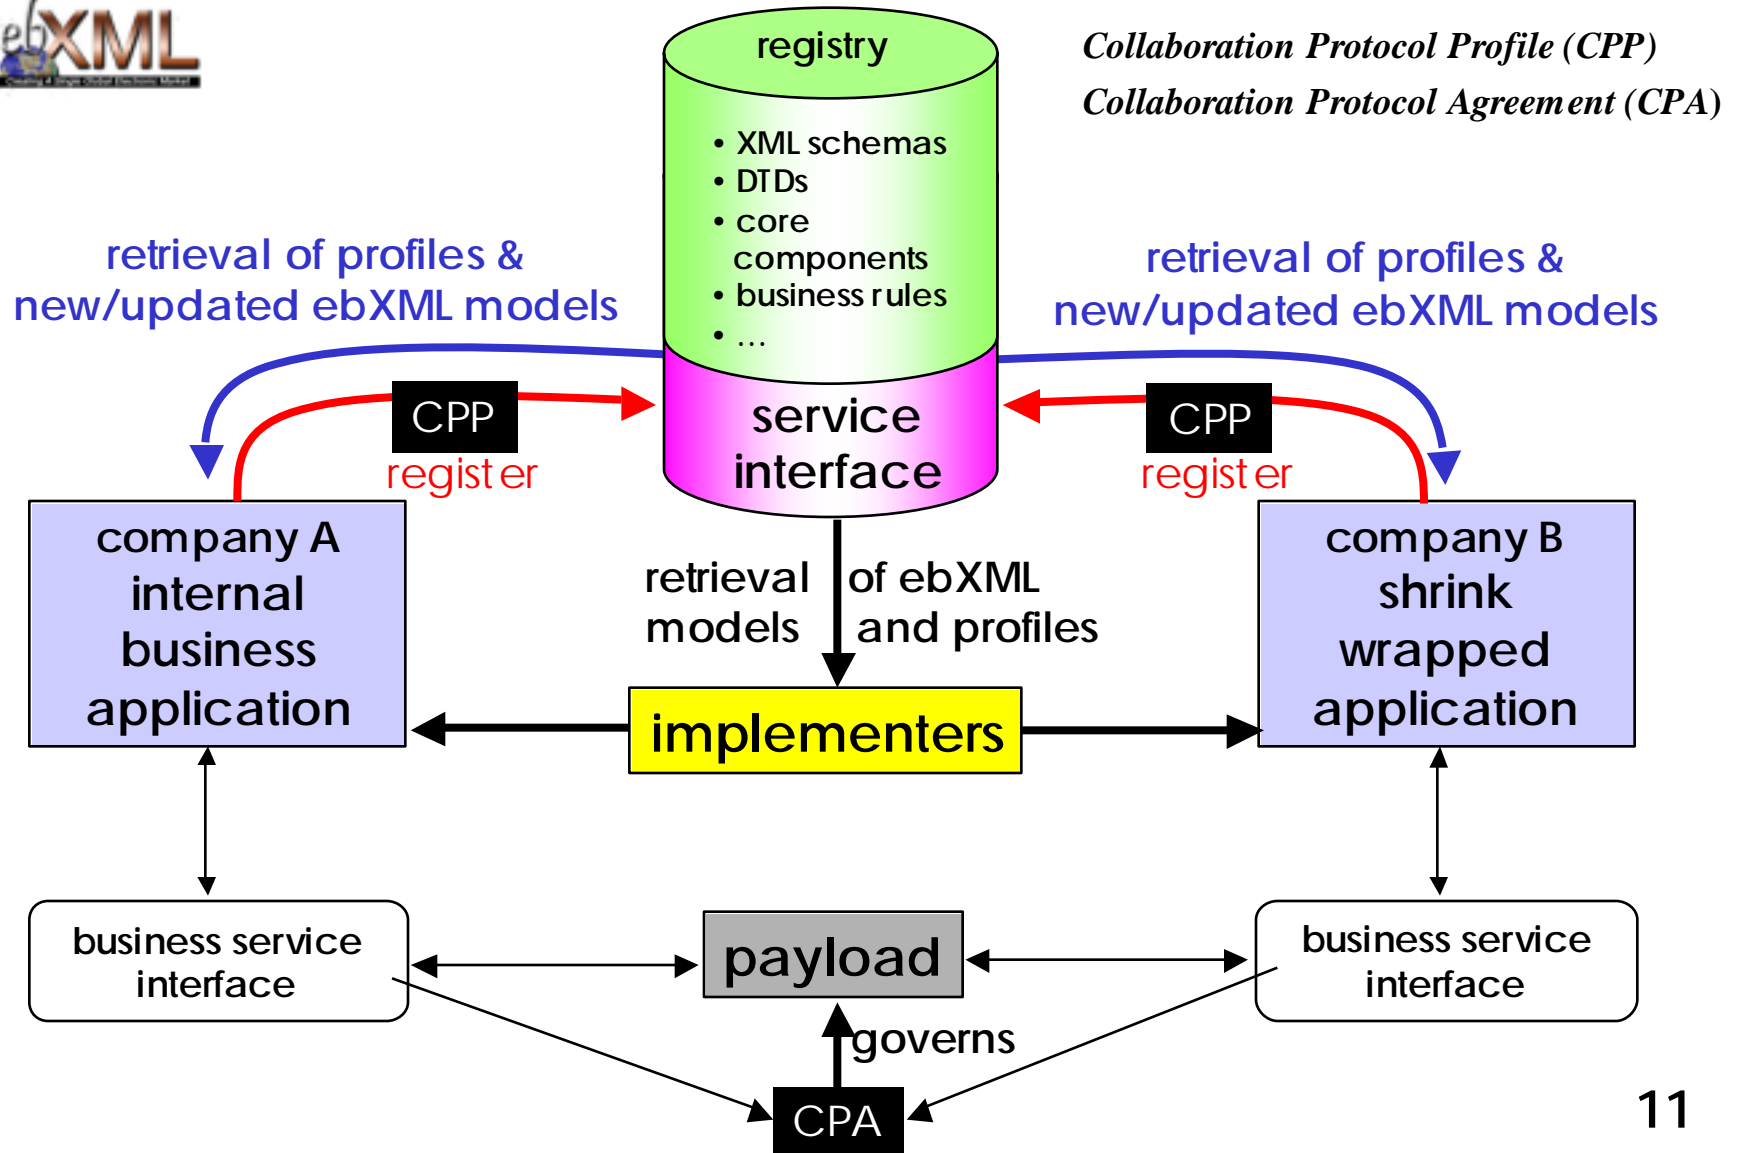

convert to XML and register

each item:

- is unique identifiable
- facilitates multilingual support
- is easy referenced

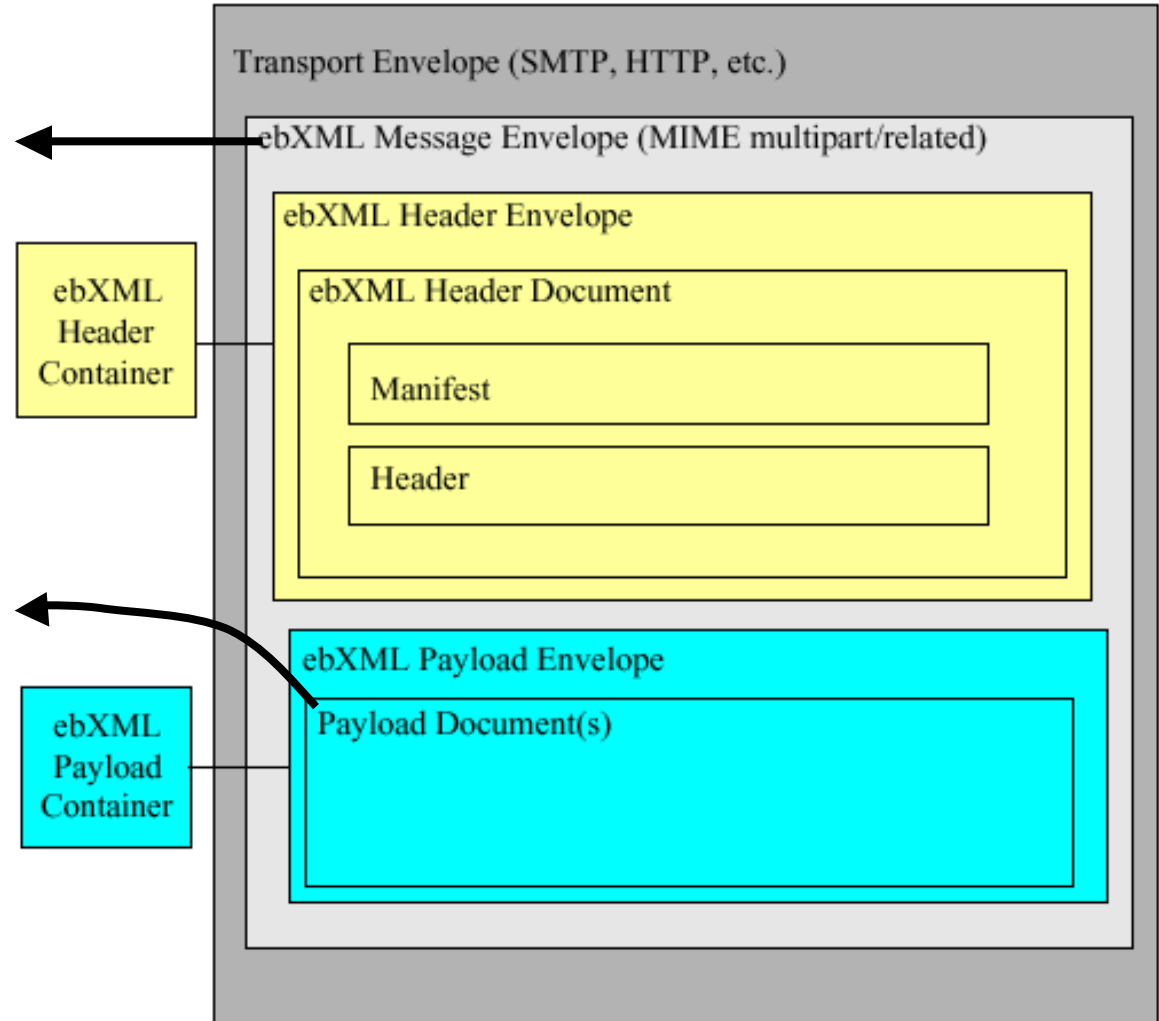

# <ebXML retrieving profiles & models>

# <ebXML transport envelop/payload>

- ebXML Message Envelope may be packaged using the **MIME multipart/related** content type
- may contain XML or other document formats e.g. images, text,...

# <ebXML message meta data>

## message example

```
<?xml version="1.0" encoding="UTF-8"?>
```

```
<ebXML>
```

root tag <ebXML>

```
<routing version="1.0">  
  <from>Trading Partner 1</from>  
  <to>Trading Partner 2</to>  
</routing>
```

routing information  
(a technical component)

```
<process type="Purchase_Order"  
  version="1.17" owner="my_company"  
  location=www.myc-repository.com/maps/>
```

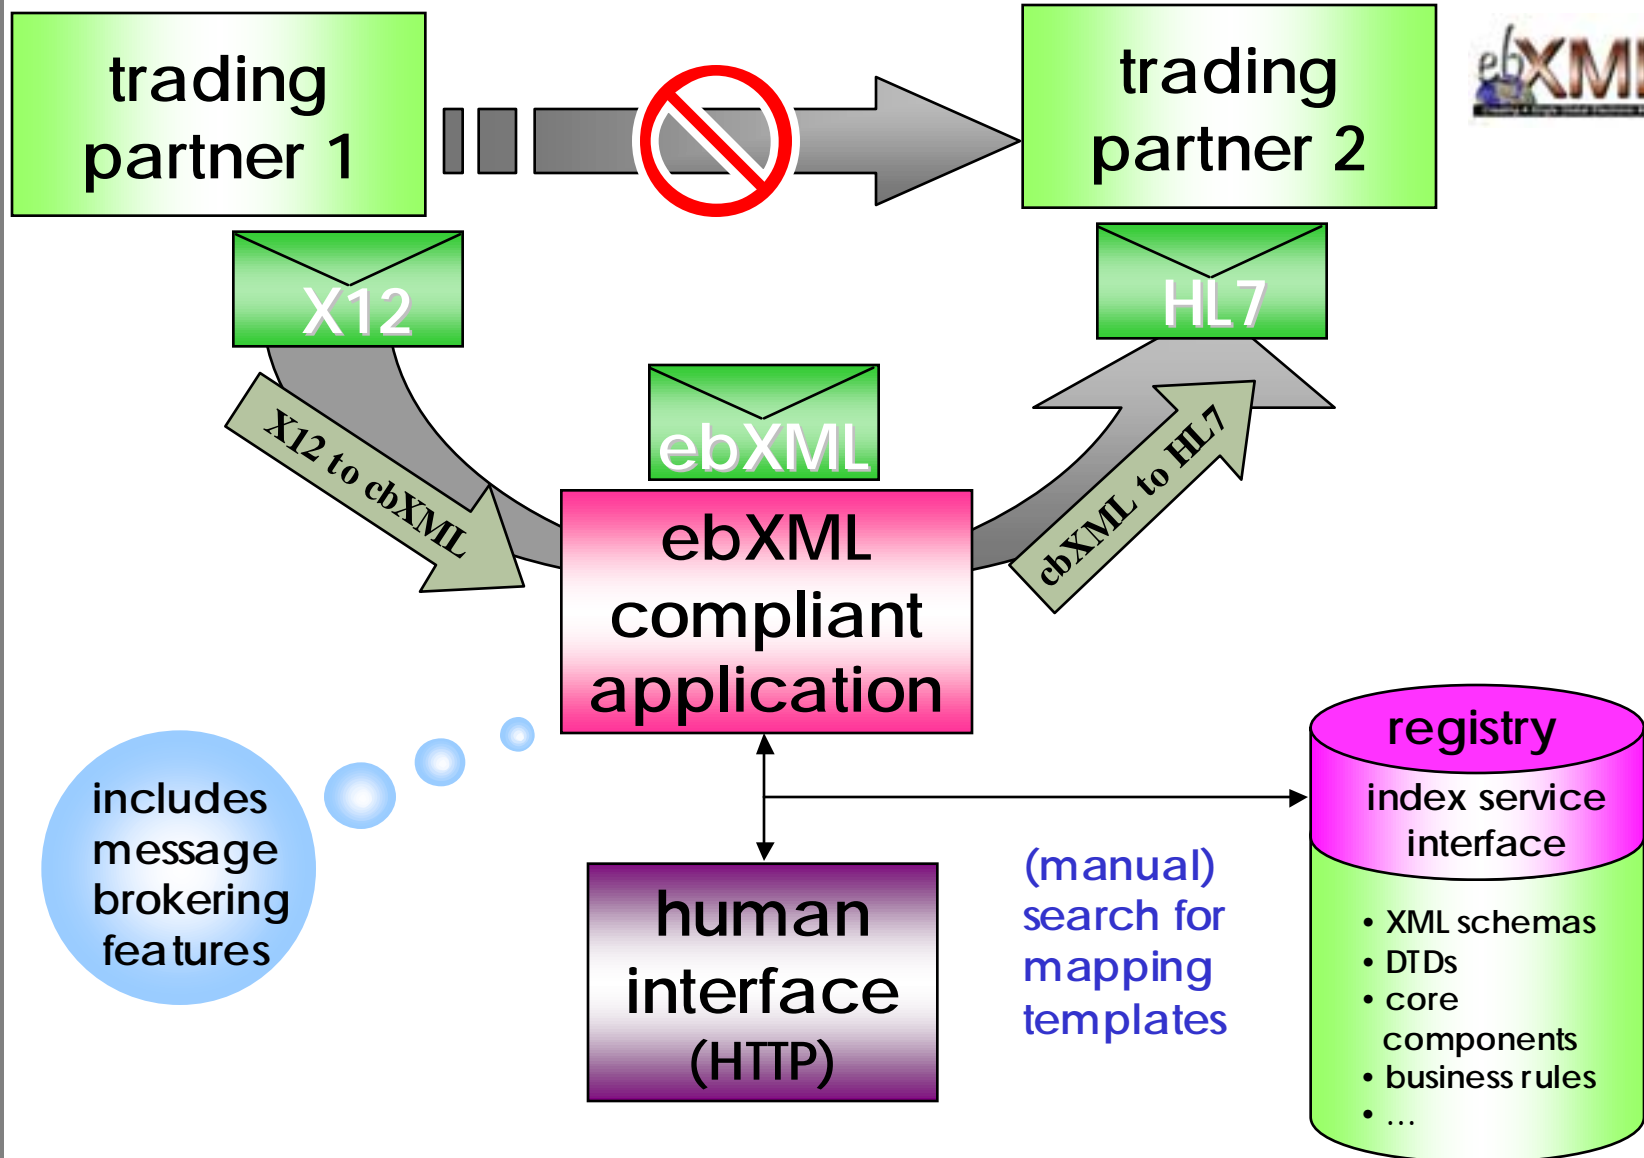

business process  
information incl. location  
for mapping template

```
.....
```

```
.....
```

```
</ebXML>
```

# <ebXML trading example>

## BizTalk

- is build on W3C XML standards
- provides implementation guidelines for XML-based document routing and exchange
- supports SOAP 1.1 for standards based messaging
- offers MIME support for business document attachments
- supplies message protocol support (HTTP, SMTP,...)
- encloses [www.BizTalk.org](http://www.BizTalk.org): community and library
- includes Microsoft's products and tools

## BizTalk

- Business processes are described in XLANG using the Visual XLANG Designer  
*(tool based on Visio)*
- XML documents can be edited with BizTalk Editor  
*(or other compliant editors: XMetaL, XML Spy)*
- XML documents can be mapped to other formats and transport protocols using BizTalk Mapper

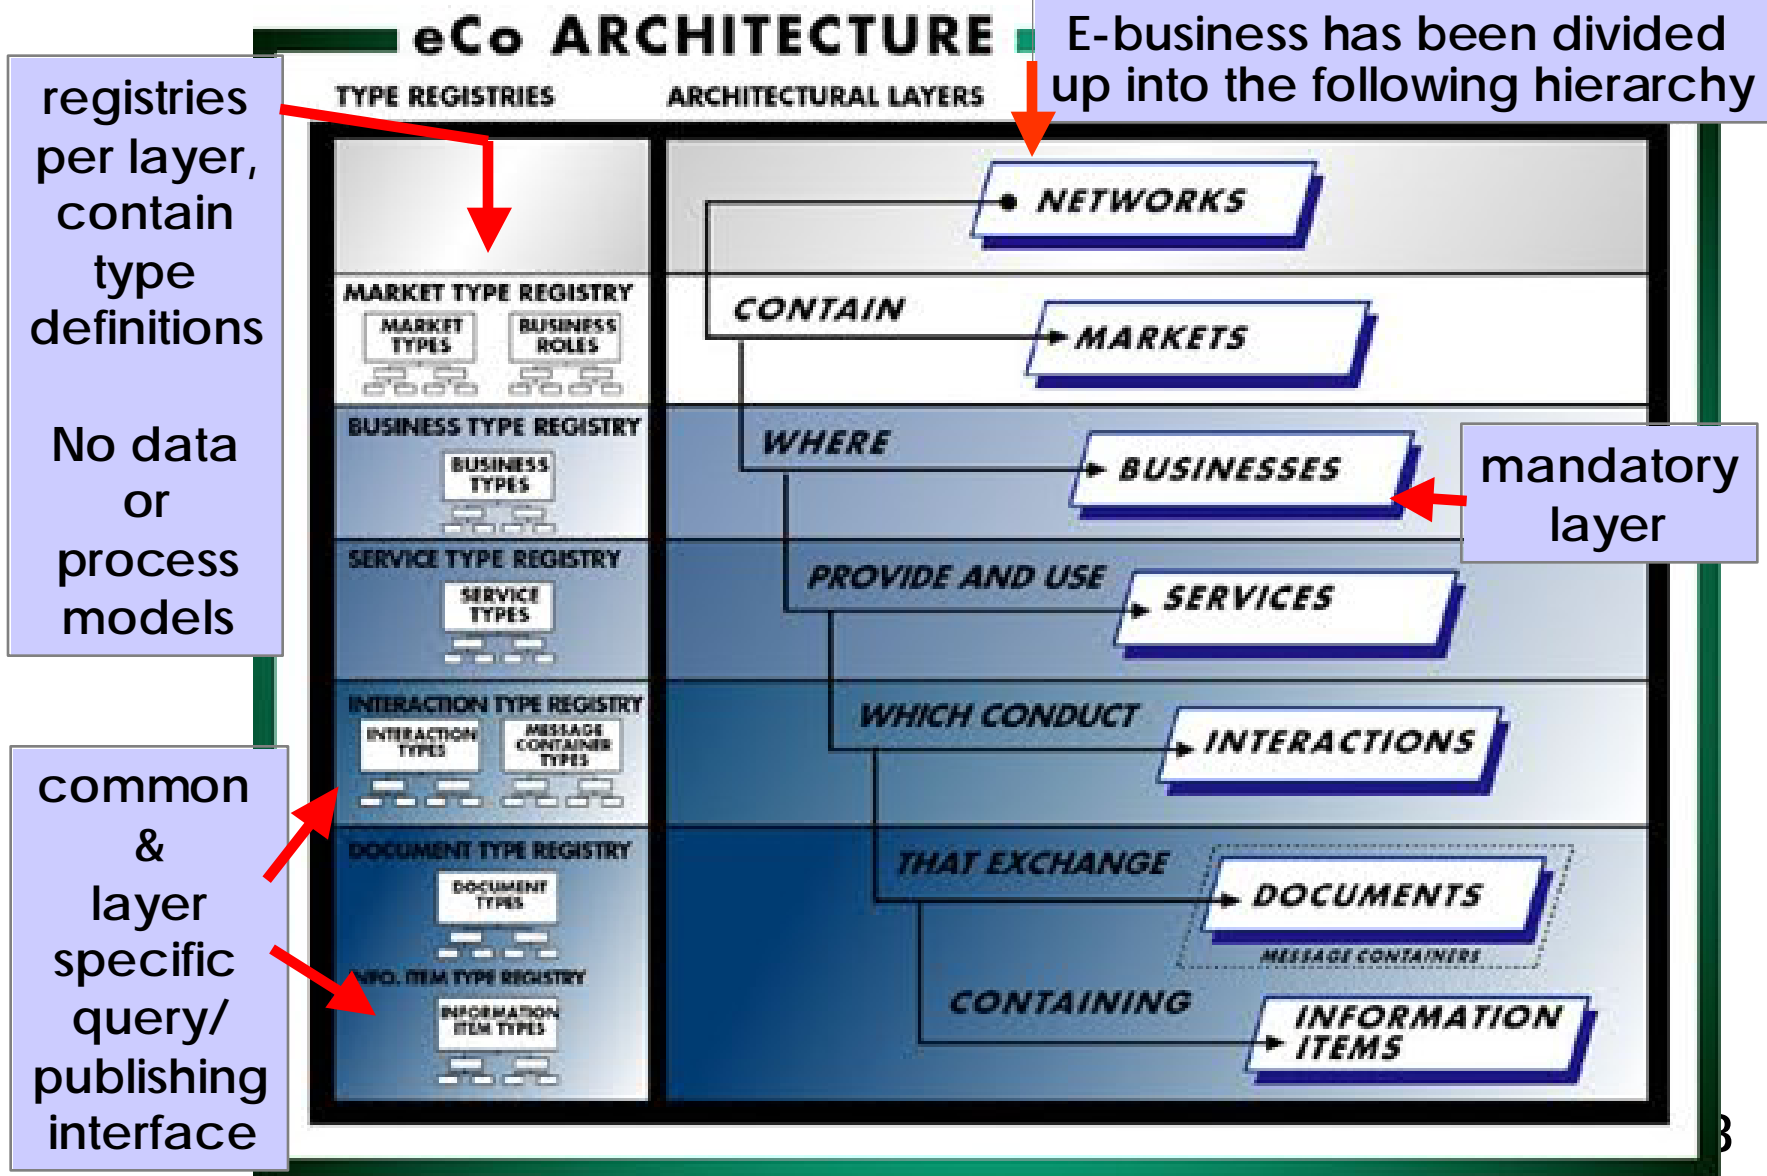

## <eCo concepts & architecture>

- CommerceNet's eCo is an architecture and a set of semantic recommendations
- eCo focuses on interaction between business partners (primarily HTTP(S) based)
- eCo describes an e-commerce system in seven layers
- Each layer can type itself by referencing type definitions in one or more registries (except network layer)

# <eCo architecture>

## <eCo query interface for layers>

- Example:  
query to a company's public interface and retrieve a list of services it offers:  
<http://www.mycompany.com/BusinessGetServices>
- This returns a XML document according to the [EcoInterfaceList.dtd](#), which presents information about published interfaces

## <Summary ebXML & BizTalk & eCo>

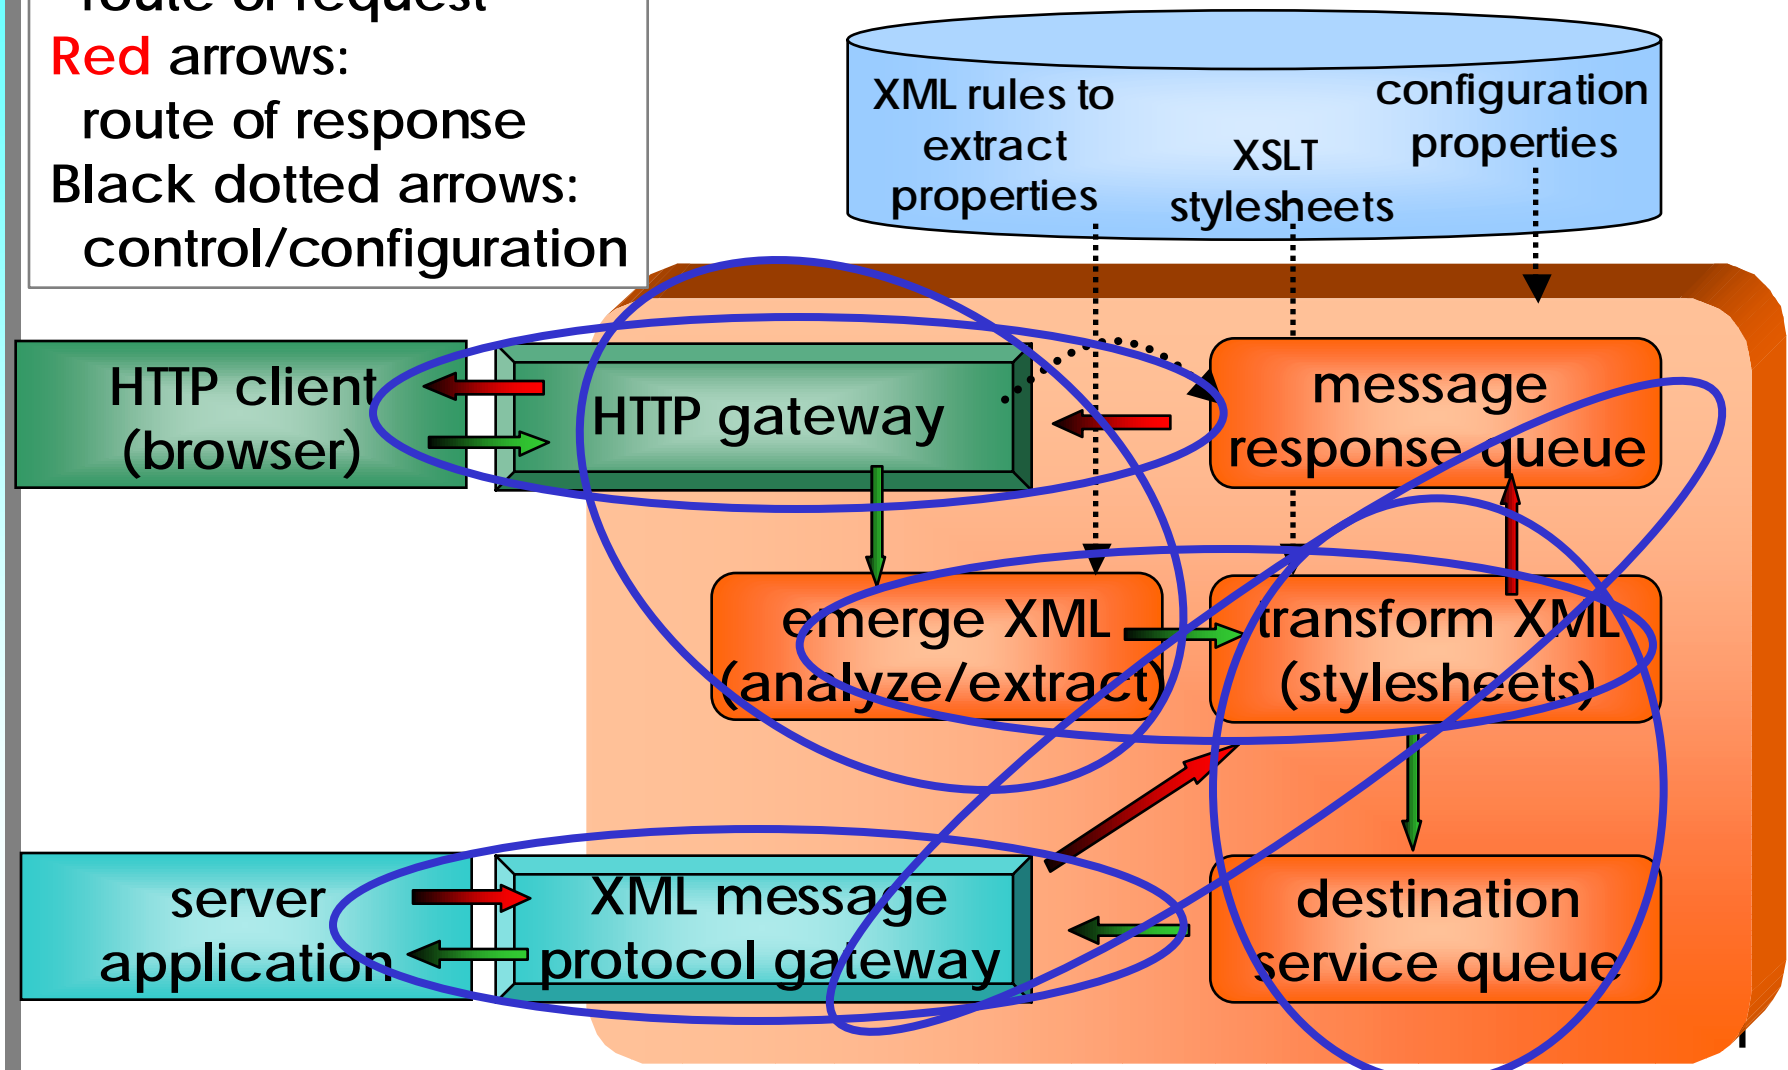

- concepts for exchanging business data

- a high-level design for attaching "payload" content to routing messages
- a specific XML schema for the "envelope"

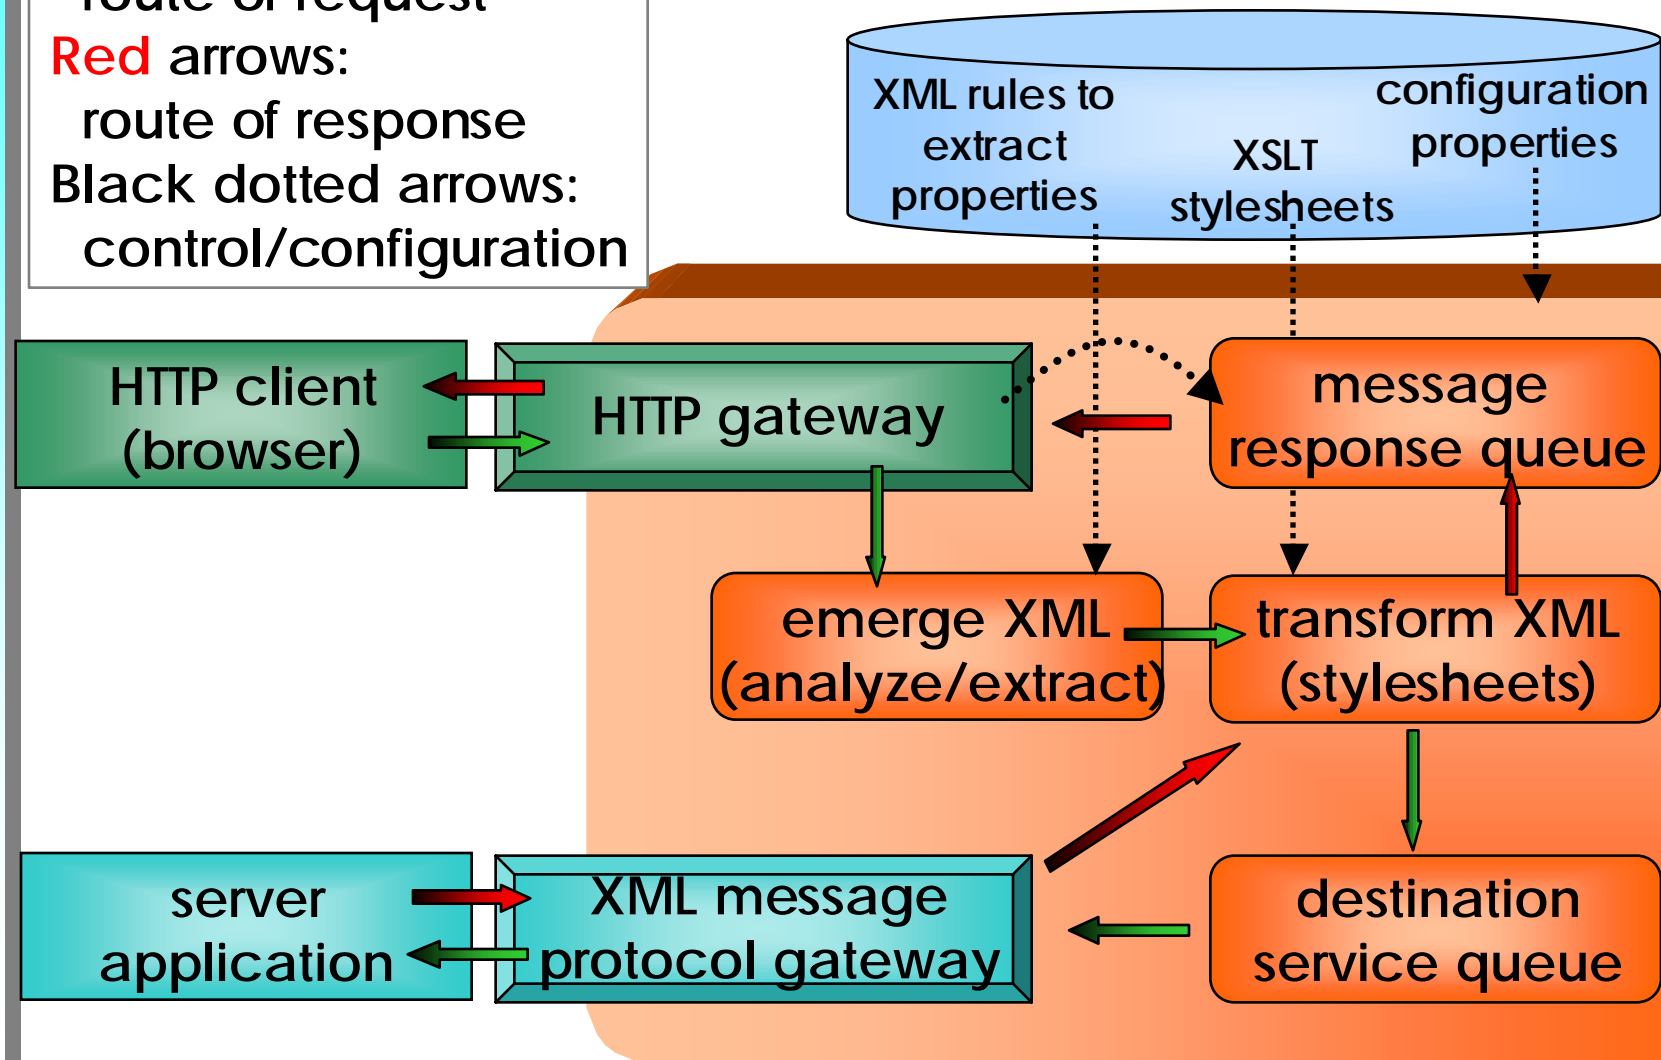

# <Architecture XML message broker>

**Green arrows:**  
route of request  
**Red arrows:**  
route of response  
**Black dotted arrows:**  
control/configuration

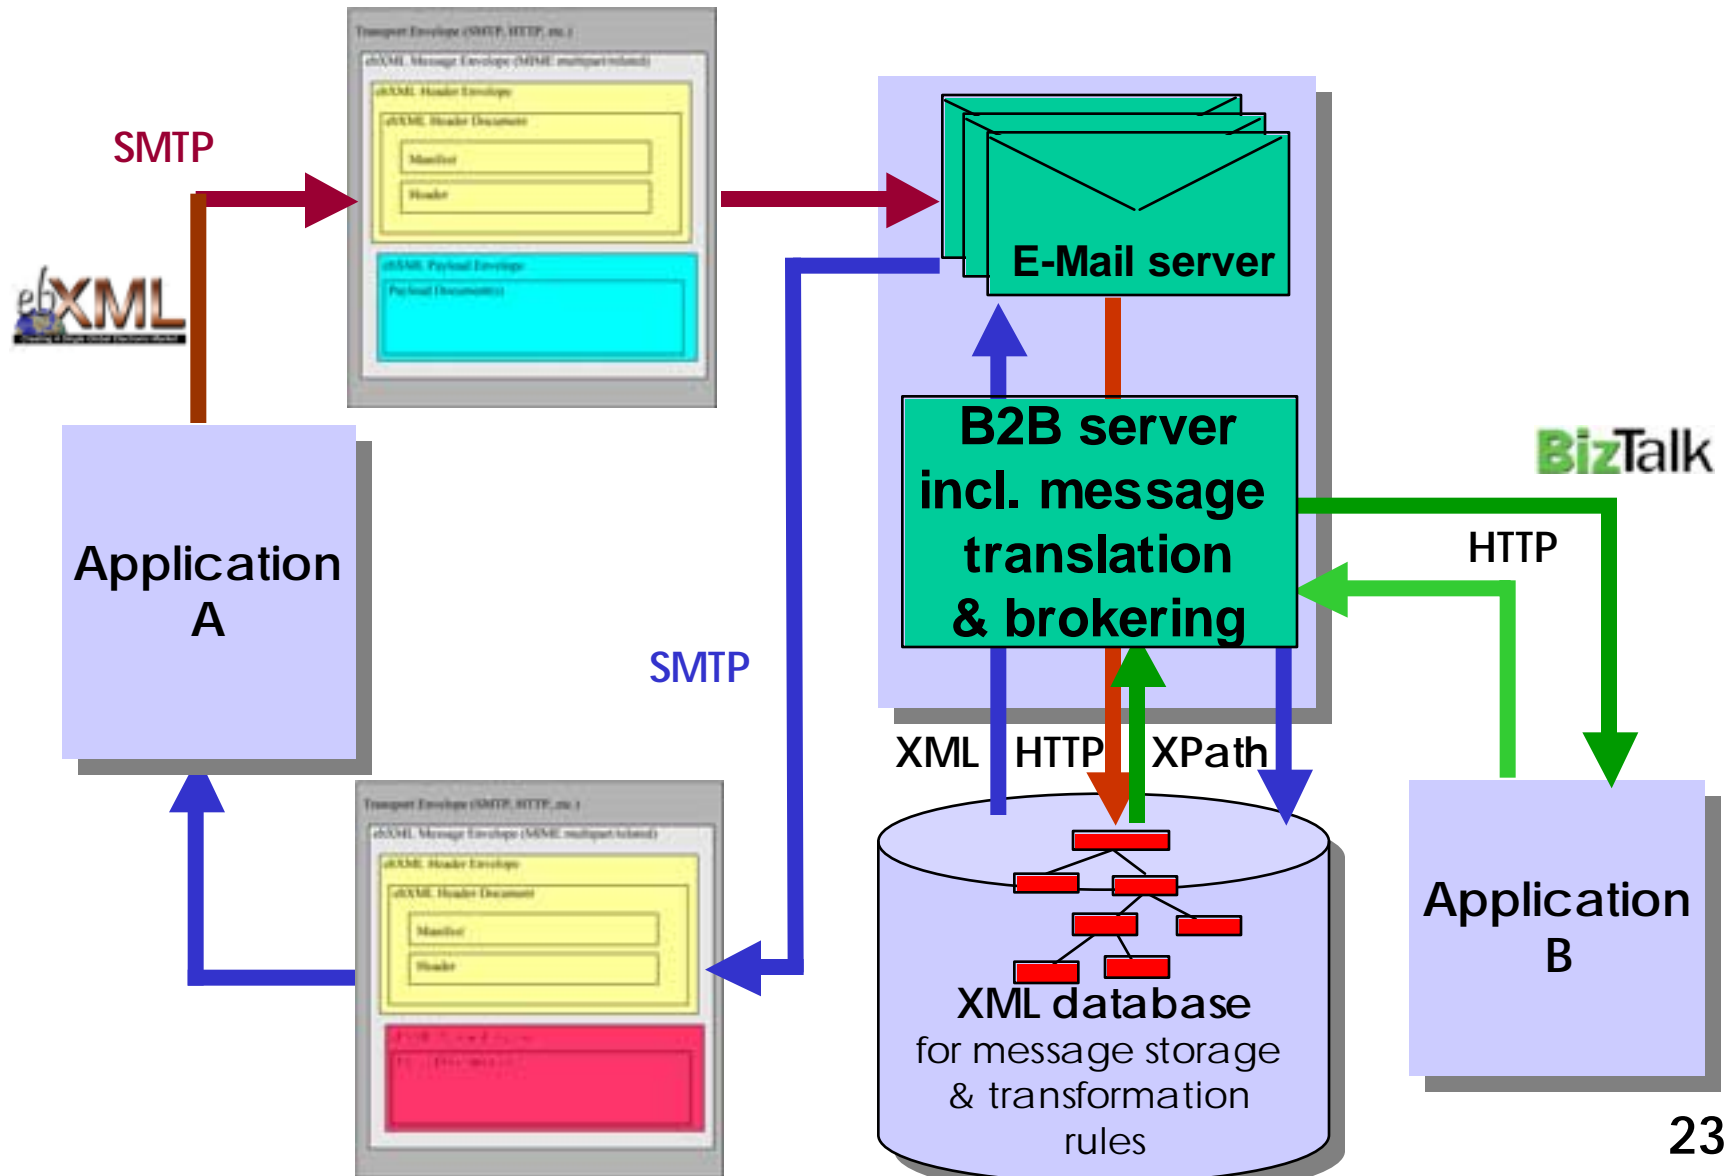

# <Architecture XML message broker>

**Green arrows:**  
route of request  
**Red arrows:**  
route of response  
**Black dotted arrows:**  
control/configuration

# <Exchanging: example B2B>

# <Exchange implies storage>

- **E-Business:**
  - exchanging electronic business information representing value (transactions)
  
- **It is about money, so:**
  - *need to* apply legal & tax rules
  - *need for* auditing
  - *need to* keep information secured
  - *need to* store & retrieve information

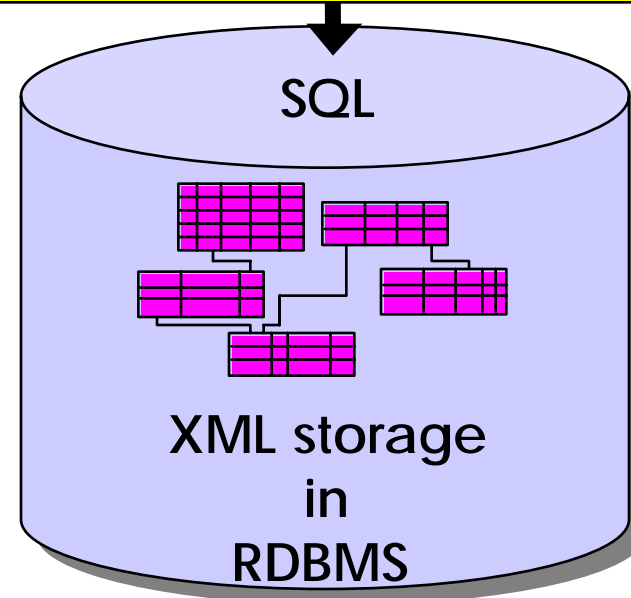

# <Storage in XML or SQL database?>

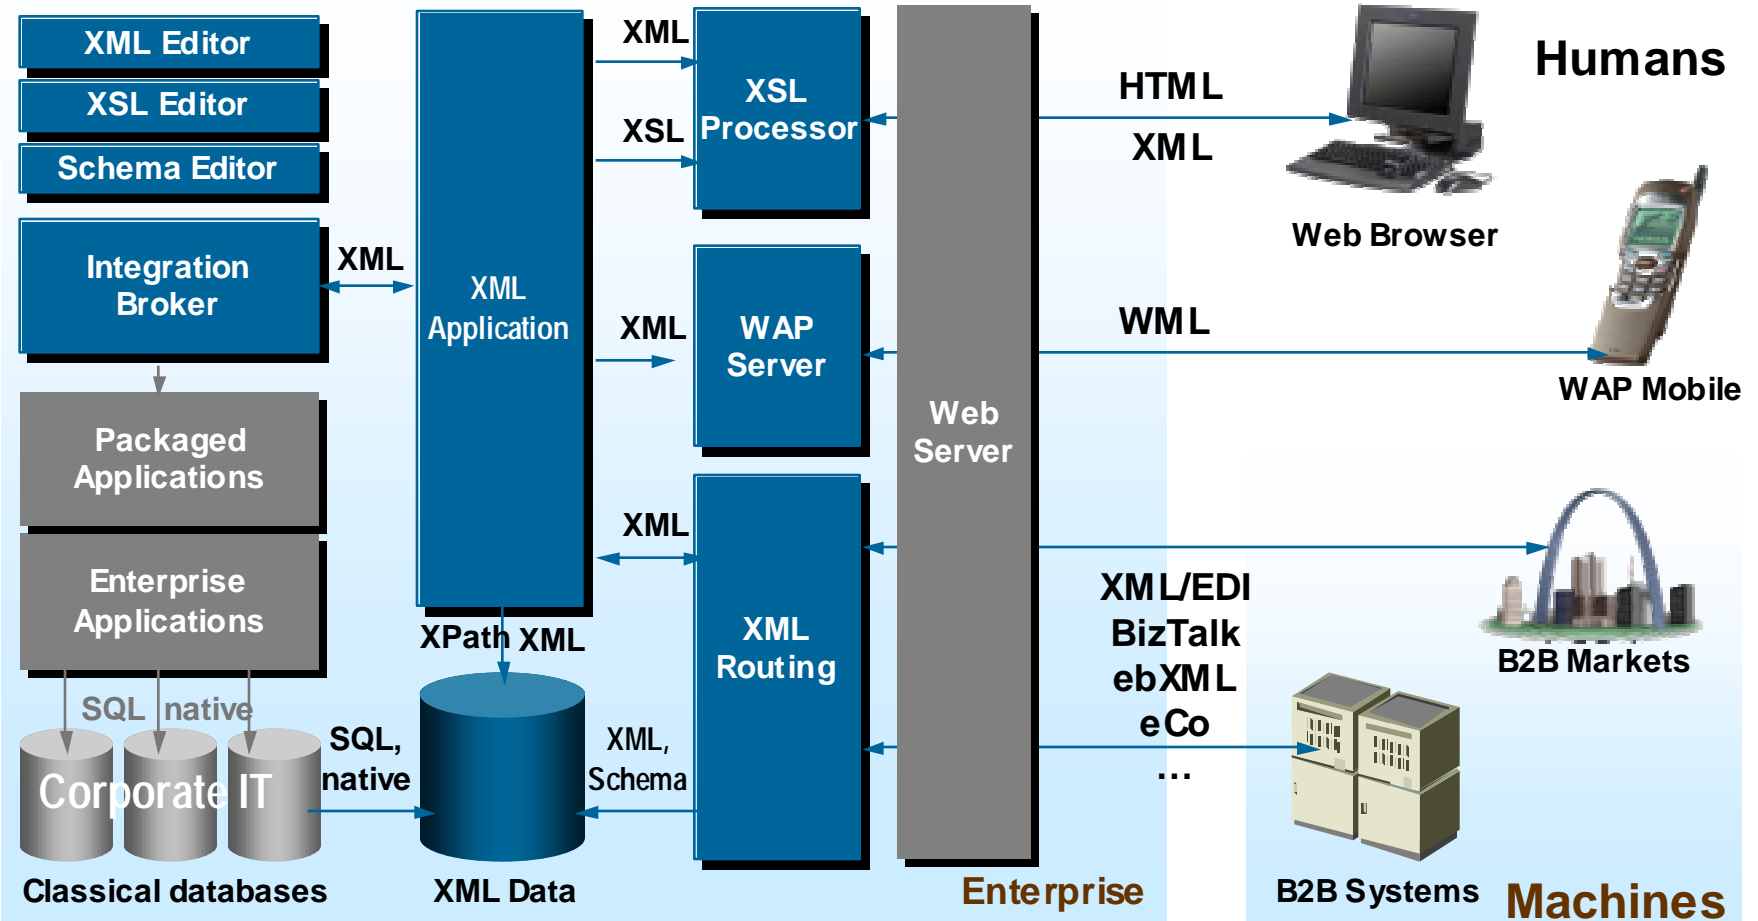

- no conversion needed
- no loss of semantic / sequence
- same as original: digital signature
- direct W3C XPath query support
- no access from SQL applications
- new technology; limited know how

- conversion of structure needed
- risk to loose semantic / sequence
- digital signature difficult: in blob?
- map XPath to SQL; vice versa
- accessible from SQL applications
- 'old' technology; well known

# <Working together >

# <Power/Pain of XML>

- XML has broad industry/government support
  - Universal W3C XML standards
  - Vendors supplying
    - XML databases,
    - development and messaging tools
    - XML applications
  - Industry specific standards for XML business documents
  
- XML is new and on the move
  - Fast emerging new standards
  - Limited know how available
  - Can be overwhelming and complex
  - Different frameworks
  - Still needs evangelisation
